

## DOCUMENT

---

The document object represents a web page that is loaded in the browser. By accessing the document object, we can access the element in the HTML page.

## WINDOW OBJECT

---

The window object is the topmost object of the DOM hierarchy. It represents a browser window or frame that displays the contents of the webpage.

Whenever a window appears on the screen to display the contents of the document, the window object is created.

DOCUMENT	WINDOW OBJECT
It represents the document loaded inside the window or browser.	It represents the browser window in which you are seeing the content
It is loaded after the loading window because the window contains a document	It is loaded before the document because window contains a document.
The document is part of BOM (browser object model) and dom (Document object model)	The window is part of BOM, not DOM
We can access the document from a window using the window. document	We can access the window from the window only. i.e. window.window
